EXECUTIVE SUMMARY

This technical report provides the results of a traffic analysis that assessed the potential effects on traffic operations along VIA's identified North/South (N/S) Corridor, part of VIA's Advanced Rapid Transit (ART) network, scheduled to begin operations in 2027. The primary purpose of the traffic analysis is to study the feasibility of dedicated transit lanes within the existing right-of-way with regard to turn lane requirements and the potential for delay at signalized intersections. To evaluate the traffic impacts of the ART N/S Corridor Project during the AM and PM peak hours of a weekday for year 2027, a traffic operation analysis was performed using Synchro.

Based on the delay experienced by vehicles at a signalized intersection, a Level of Service (LOS) is assigned to represent the existing or anticipated quality of service experienced by drivers during the peak travel hours. LOS A represents the best operating conditions during analysis periods, and LOS F represents the worst conditions. Per the Texas Department of Transportation (TxDOT) Roadway Design Manual, heavily developed urban areas may necessitate the use of LOS D for the design. LOS E, which represents near capacity and when congestion is imminent during busier times of the day/year, is typically accepted for multimodal projects.

This analysis solely focuses on vehicle operations. The existing roadway geometry without the ART N/S Corridor Project is referred to as No Build in this memorandum, and the roadway geometry with the ART N/S Corridor Project is referred to as Build. A summary of the results is as follows:

2027 AM Peak (Open Year)

- Without the ART N/S Corridor Project (No Build), 59 signalized intersections are expected to operate at LOS D or better, one signalized intersection is expected to operate at LOS E, and one signalized intersection is expected to operate at LOS F.
- With the ART N/S Corridor Project (Build), 60 signalized intersections are expected to operate at LOS D or better, one signalized intersection is expected to operate at LOS E, and none would operate at LOS F.
- This analysis suggests the ART N/S Corridor Project (Build) has no significant impact on traffic operations when compared with No Build.
- Traffic operations were improved by adding additional turn lanes and modifying the signal phasing and cycle length at the intersections.

2027 PM Peak (Open Year)

- Without the ART N/S Corridor Project (No Build), 57 signalized intersections are expected to operate at LOS D or better, two signalized intersections are expected to operate at LOS E, and two signalized intersections are expected to operate at LOS F.
- With the ART N/S Corridor Project (Build), 58 signalized intersections are expected to operate at LOS D or better, three signalized intersections are expected to operate at LOS E, and none would operate at LOS F
- This analysis suggests the ART N/S Corridor Project (Build) has no significant impact on traffic operations when compared with No Build.
- Traffic operations were improved by adding additional turn lanes and modifying the signal phasing and cycle length at the intersections.

The results of the traffic analysis suggest that the application of the ART N/S Corridor Project is feasible, and it would have no significant impact on general traffic operations.

1. INTRODUCTION

VIA Metropolitan Transit Authority (VIA) adopted its long-range plan, Vision 2040, in 2016. The plan identified ideal corridors within the VIA service area for high-capacity transit service.

Between 2017 and 2018, VIA completed an extensive planning and alternatives analysis that led to the development of a proposed Rapid Transit Network (Rapid Transit Network Plan, October 2018). This network, locally known as Advanced Rapid Transit (ART), applies Bus Rapid Transit characteristics such as dedicated transit lanes and transit signal priority to improve transit travel time and reliability. The culmination of that effort led to the identification and prioritization of four merged corridors for rapid transit investment, including the ART North/South (N/S) and East/West (E/W) Corridors. The ART N/S Corridor was determined to advance first. ***Figure 1-1*** shows an overview of the ART N/S Corridor.

This memorandum summarizes the traffic analysis that was completed to understand the impacts of implementing the ART N/S Corridor Project. The analysis was performed using the traffic analysis microsimulation software, Synchro, for the No Build base year 2019 as well as the No Build and Build scenarios for the opening year 2027. The roadway geometry without the ART project is referred to as No Build, and the roadway geometry with the ART project is referred to as Build. Improvements that are proposed outside the ART N/S Corridor Project, such as those at the San Pedro Avenue and Loop 410 interchange, San Pedro Avenue and Myrtle Street, San Pedro Avenue and Park Avenue, St Mary's Street and Convent Street, and San Pedro Avenue and Mandalay Drive, have been considered for both No Build and Build opening year models.

Intersection Level-of-Service for planning and concept acceptance used the Highway Capacity Level-of-Service methodology from the Synchro software. A microsimulation using VISSIM was also performed to optimize intersection operations, determine turn lane lengths, and mitigate queuing a detailed description is provided in Section 5.1.

1.1 Study Area

From north to south, the ART N/S Corridor begins at the San Antonio International Airport, generally paralleling US 281 for a short distance to the intersection of Isom Road and US 281. At this intersection/interchange, the ART would continue along Isom Road before turning south onto San Pedro Avenue. Following a stop at the North Star Transit Center, the ART would continue along San Pedro Avenue south toward downtown. Through downtown, the alignment would operate as a couplet pair, south along St. Mary's Street and north along Navarro Street. On the south side of downtown, the alignment would continue along St. Mary's Street, which eventually becomes Roosevelt Avenue near Roosevelt Park, and terminate at Steves Avenue. ***Figure 1-1*** illustrates the ART N/S Corridor.

The ART N/S Corridor is approximately 11.7 miles long, with 27 station areas traversing over 60 signalized intersections. The Synchro analysis was completed for the intersections along the corridor listed in ***Table 1-1***. Operationally, the ART is currently anticipated to operate at 10- to 15-minute headways between the terminus points defined above. Continuation of transit services is planned north to the Stone Oak Park-and-Ride, as well as south to the Brooks Transit Center. No improvements are planned along the service extensions and are not considered in this traffic analysis.

2. EXISTING TRAFFIC DATA

2.1 Roadway Geometry

The geometric data of the study area (e.g., the number of lanes and lane configurations) was collected from Open Street Map GIS database, Google Earth 3D environment, Google Street View, and field visits. The geometry was coded in Synchro to develop the operational analysis models.

2.2 Signal Timing

The City of San Antonio provided signal timing sheets for 50 signalized intersections along the proposed ART N/S Corridor route. Appendix G contains a copy of these signal timing sheets. For the remainder of the intersections without signal timing sheets, signal phasing was determined based on the visual inspection of signal heads at each approach. For these intersections, after determining the phasing, the splits and other parameters of timing were coded into the Synchro model.

2.3 Traffic Counts

The City of San Antonio provided traffic volume counts of turning movements at the intersections, referred to as turning movement counts, for 49 signalized intersections along the North/South corridor. These counts were collected in May 2019. Supplemental data collection was performed in December 2021 and January 2022 for unsignalized intersections and driveways along San Pedro Avenue between Olmos and Rector. The counts were collected in 15-minute intervals between 7:00 AM to 9:00 AM and from 4:00 PM to 6:00 PM.

Within the ART N/S Corridor, traffic counts were not available at eight intersections:

- Oasis St at Isom Road
- Sahara Dr at Isom Road
- San Pedro Ave at VIA Station south of Loop 410
- San Pedro Ave at Evergreen Street
- Navarro at Soledad
- St Mary's at College
- St Mary's at Convent
- St Mary's at Biering

The turning volumes for these eight intersections were estimated using the demand matrix estimation procedure utilizing the available count data of other intersections within the study area.

3. FUTURE TRAFFIC DATA

3.1 Demand Projection for Future Conditions

To predict future demand along the corridor, traffic volumes for facilities within the study area during 2017, 2025, 2035, and 2045 were studied using data obtained from the Alamo Area Metropolitan Planning Organization (AAMPO) model. The predicted traffic volumes were compared, and their annual growth rates were calculated until 2027 (the opening year of the ART N/S Corridor Project). To refine the growth rate further, the study area was divided into five segments based on land use, and the growth rates were calculated and applied separately for each segment. *Table 3-1* illustrates the growth rate calculated for each segment.

Table 3-1 Growth Rate Summary – North/South Corridor

Segment	Corridor	From	To	Growth Rate		
				2017-2025	2025-2035	2035-2045
Segment 1	Roosevelt Ave	Steves Ave	Nueva/Navarro	3.02%	2.12%	2.00%
Segment 2	St Mary's St	Nueva/Navarro	Main St	2.86%	1.66%	1.88%
Segment 3	San Pedro Ave	Main St	Hildebrand	1.92%	1.44%	1.56%
Segment 4	San Pedro Ave	Hildebrand	Jones Maltsberger Rd	1.63%	1.46%	1.24%
Segment 5	SAT Airport	Jones Maltsberger Rd	SAT Airport	1.00%	1.64%	1.00%
Overall Corridor				2.00%	1.58%	1.48%

Note: SAT = San Antonio International Airport

These growth rates were applied to the collected turning movements to obtain projected traffic volumes for the AM and PM peak hours of the scheduled opening year of the ART N/S Corridor Project (2027).

3.2 Diversion Volume Estimate Process

In addition to the collected peak hour turning movement count data, the analysis included other considerations to accurately model the impacts of the proposed ART N/S Corridor on peak hour traffic patterns.

Due to changes in access associated with the Build conditions of the proposed ART N/S corridor, some existing turning movements are expected to be rerouted. For side street left turning and through movements that would no longer be permitted under the Build and access conditions associated with the ART N/S Corridor, those movements are assumed to reroute evenly via the two nearest remaining access points (one in each direction assuming the initial point of reroute was reasonably central to two) which would allow them to reach their original destination. Similarly, any locations where existing mainline turning movements would no longer be permitted under the proposed Build conditions would have these movements rerouted evenly between the two nearest remaining points of access to reach their perceived original destination.

For construction of the ART N/S Corridor, some amount of traffic diversion reduction would occur. San Antonio Multimodal Model Version 4.1 (SAMMv4.1) was used to understand the traffic impact of the proposed ART corridor. The 2025 SAMM model allowed for comparisons to be made in the year 2025

(nearest SAMM model year to the proposed ART open year) between No Build and Build volumes along various subsections of the proposed corridor. These comparisons display various amounts of traffic diversion reductions along the ART N/S Corridor under the Build conditions. These diversion reductions in 2025 traffic volumes at various points along the proposed corridor are shown in ***Table 3-2***, and a detailed map showing diversion reductions is included in Appendix B.

Table 3-2 2025 TDM Traffic Diversion Reductions

No.	Cross Street	% Difference		
		North	South	Average
1	Rector Dr	-4.2%	-11.7%	-8.2%
2	Rampart	-11.7%	-12.5%	-12.1%
3	Oblate	-14.4%	-15.9%	-15.1%
4	Jackson - Keller Rd	-16.5%	-22.2%	-19.0%
5	Basse Rd	-20.7%	-25.4%	-23.1%
6	Dora	-32.7%	-27.6%	-30.4%
7	Hildebrand	-35.9%	-31.5%	-33.3%
8	Summit Pkwy	-26.6%	-33.4%	-30.3%
9	Woodlawn Ave	-35.5%	-37.8%	-36.5%
10	Ashby	-37.8%	-34.4%	-36.0%
Overall		-21.7%	-23.4%	-22.6%

To provide a conservative design and to avoid overestimating the magnitude of traffic diversion reduction due to the proposed Build conditions, a design traffic reduction percentage (using engineering judgment) was selected. ***Table 3-3*** shows these values.

Table 3-3 Applied Traffic Diversion Reductions

No.	Segment	% Reduction
1	South of Cypress	0.0%
2	Cypress to Basse	15.0%
3	Basse to Rector	7.0%

Although mode shift will occur as the public becomes more familiar with the benefits of transit, opening year assumes no mode shift as a conservative assumption in the model. To provide an accurate estimate of traffic volume, these diversion reductions were applied concurrently with growth factors to determine peak hour volumes. The peak hour traffic volumes used in this analysis are provided in Appendix A. Figure 1, Figure 2, and Figure 3 in Appendix A show the Base Year No Build, Open Year No Build, and Open Year Build peak hour traffic volumes, respectively.

4. TRAFFIC ANALYSIS

The primary purpose of the traffic analysis is to examine the feasibility and impact of ART lanes and identify turn lane requirements for general traffic to maintain a satisfactory flow of vehicular traffic.

To evaluate the traffic operations of the proposed design during the morning and afternoon/evening weekday peaks, an operational analysis was done using Synchro software Version 11. Synchro evaluates the performance of the intersection and provides results that closely follows the Highway Capacity Manual (HCM) methodology.

4.1 Base Year No Build (Existing Conditions)

Existing condition Synchro models were developed for the ART N/S Corridor using geometric data, traffic count data, and signal timing data.

4.2 Open Year No Build

The Open Year No Build scenario assumes no changes to the existing geometry except for the improvements that are proposed outside the ART N/S Corridor Project. These improvements are focused at the following locations:

1. San Pedro Avenue and Loop 410 interchange

   TxDOT is planning to improve the San Pedro Avenue and Loop 410 interchange as part of its US 281 improvement project. This project is expected to open in 2023 and, therefore, it is assumed that these improvements will be completed prior to opening of the ART project. These improvements are included in Opening Year No Build Synchro. Appendix C shows the geometric changes that are proposed for this interchange under the TxDOT project.

2. Myrtle Street and Park Avenue at San Pedro

   A new parking garage was constructed west of Park Street and San Pedro Avenue intersection. This converts the four-leg intersection to a “T” intersection, with no west leg.

3. St Mary’s and Convent Street

   This intersection is currently stop controlled but is planned to be converted to a signalized intersection in the future.

4. San Pedro and Mandalay Drive

   This intersection is currently stop controlled but is planned to be converted to a signalized intersection in the future

The existing conditions for the ART N/S Corridor roadways were input into the Synchro models created for the base year and used as the basis to develop the No Build Synchro model. Because the ART N/S Corridor Project is expected to open in 2027, this year was used for the No Build Synchro analysis.

To project the demand from 2019 to 2027, the growth factors of the traffic demand were calculated and applied as described in Section 3.1 of this memorandum.

4.3 Open Year Build

The Build scenario assumes that improvements proposed as part of the ART N/S Corridor Project as well as the improvements proposed outside the ART N/S Corridor Project (improvement at San Pedro Avenue and Loop 410 listed in the previous section) will be implemented. The Open Year Build models were created based on the Open Year No Build peak hour models mentioned above and by applying the proposed roadway concept to the geometry of the intersections included in the study area. The intersection's geometry was modified per the proposed concept drawings, dated March 29, 2022, developed for the ART N/S Corridor Project and as necessary to create satisfactory vehicular traffic operations. In addition, traffic signal timing was adjusted at various intersections to improve traffic flow within the project limits. The downtown signals retained their existing 100 second cycle lengths as did most existing splits and offsets (exceptions include Convent & St. Mary's, Houston & Navarro, Commerce & Navarro, and St Mary's/Navarro & Nueva). Note that left turns along San Pedro Avenue were revised to Protected Only when ART was located within the median. Appendix D shows the proposed concept N/S ART drawings used for this analysis.

4.3.1 Geometry Changes for Operational Needs.

4.3.1.1 Medians

To support the ART operations for center-running segments, additional medians are recommended to improve safety, encourage compliance of lanes, and provide continuity of the lanes system. Prohibiting vehicle turns across the roadway is a best practice because the ART configuration operations differ from typical roadway cross-sections.

To confirm safety improvements, TxDOT's Crash Record Information System (CRIS) was queried to obtain study area crash data for five years between 2015 and 2019. The goal of this was to identify incidents occurring within the center-running segments currently that may be mitigated due to access management and restricted turns created by the proposed center-running dedicated lanes. The following methodology was used for the safety analysis along median section of the ART N/S Corridor Project:

- Develop crash data for the corridor for the existing condition.
- Develop crash data for the N/S corridor with the ART N/S Corridor Project.
- At the signalized intersections, no improvements related to the ART N/S Corridor Project assumed as the median is open, and all movements are allowed.
- Angle crashes related to left turn movements are removed because these will be improved with center median BRT implementation.
- Prepare crash summary for the existing and proposed condition for comparison.

Based on review of the crash data, the proposed center median is expected to reduce the crashes by approximately 15%. Appendix E provides an exhibit showing crash analysis with and without the median.

4.3.1.2 Protected Signal Changes

At signalized intersections along ART N/S Corridor Project's center running sections, protected lefts are recommended to improve safety because motorists are less likely to see and anticipate the ART vehicle. This change from permitted lefts to protected will increase some delays at these left turn lanes.

4.3.1.3 Intersection Improvement

Intersections where additional geometric changes were included to improve LOS include:

- San Pedro & Rector – Addition of EBL bay on Rector
- San Pedro & Rampart Dr – Addition of WBL lane on Rampart Drive
- San Pedro & Recoleta Road– Addition of EBL and WBL bays on Recoleta Road
- San Pedro & Wildwood – Addition of EBL and WBL lanes on Wildwood
- San Pedro & Audubon Drive – Addition of EBL and WBL bays on Audubon Drive
- San Pedro & Dora Street/Fresno - Addition of EBL bay, and EBR lane converted to right-only lane on Fresno
- San Pedro & Olmos Drive – Addition of WBL bay, and WBR only bay extended to right-only lane on Olmos Drive
- San Pedro & Hildebrand Avenue – Addition of EBL and WBL bays on Hildebrand Avenue
- San Pedro & Summit – Addition of EBL and WBL bays on Summit
- San Pedro & Mulberry Avenue – Addition of EBL bay and WBL lane on Mulberry Avenue
- San Pedro & Woodlawn Avenue – Addition of EBL and WBL lanes on Woodlawn Avenue
- San Pedro & Laurel – Addition of EBL bay on Laurel
- San Pedro & Cypress Street – Addition of EBL and WBL bays on Cypress Street

5. TRAFFIC ANALYSIS RESULTS SUMMARY

Based on the delay experienced by vehicles through the intersection, the Synchro software assigns a LOS to represent either the existing or anticipated quality of service. The HCM defines six levels of service, ranging from A to F. LOS A represents the best operating conditions during analysis periods, and LOS F represents the worst conditions. Vehicles passing through an intersection with LOS F will experience significant delay and will have to wait for more than one cycle to clear the intersection. Per the TxDOT Roadway Design Manual, heavily developed urban areas may necessitate the use of LOS D for roadway design. LOS E represents near capacity and congestion is imminent during busier times of the day/year and is typically accepted for multimodal projects.

Table 5-1 shows the performance measures used for the HCM analysis and the thresholds for assigning the LOS.

Table 5-1 HCM Performance Measures – Signalized intersection

LOS Threshold	Delay (Seconds per Vehicle)	Congestion Condition
LOS A	<=10	Free flow, no delay
LOS B	>10-20	Stable flow, slight delay
LOS C	>20-35	Stable flow, acceptable delay
LOS D	>35-55	Approaching unstable flow
LOS E	>55-80	Unstable flow, significant delays
LOS F	>80	Forced flow, queue fails to clear

Table 5-2 summarizes the Synchro intersection results for each scenario.

Table 5-2 Synchro Intersection LOS Summary

	# Intersections					
	Base Year No Build		Open Year No Build		Open Year Build	
LOS	AM	PM	AM	PM	AM	PM
D or Better	57	58	59	57	60	58
E	2	0	1	2	1	3
F	1	2	1	2	0	0

In the existing conditions or Base Year No Build:

- 57 intersections operate at LOS D or better for the AM peak and 58 intersections operate at LOS D or better for the PM peak.
- Two intersections operate at LOS E for the AM peak.
- One intersection operates at LOS F for the AM peak, and two intersections operate at LOS F for the PM peak.

Without the ART N/S Corridor Project (Open Year No Build):

- 59 intersections operate at LOS D or better for the AM peak, and 57 intersections operate at LOS D or better for the PM peak.
- One intersection operates at LOS E for the AM peak, and two intersections operate at LOS E for the PM peak.
- One intersection operates at LOS F for the AM peak, and two intersections operate at LOS F for the PM peak.

With the ART N/S Corridor Project (Open Year Build):

- 60 intersections operate at LOS D or better for the AM peak, and 58 intersections operate at LOS D or better for the PM peak.
- One intersection operates at LOS E for the AM peak, and three intersections operate at LOS E for the PM peak.
- None of the intersections operates at LOS F for the AM peak or PM peak.

The results of the traffic analysis in Synchro suggest that the application of the ART N/S Corridor Project is feasible, and no significant impact is expected on general traffic operations.

Table 5-3 summarizes the peak hour intersection-wide LOS and delay for all intersections in the study area. Appendix F contains a detailed summary table for each scenario's Synchro results.

Table 5-3 Synchro Intersection Analysis Summary

5.1 Vissim Analysis

In addition to Synchro models, Vissim models were also developed for the existing year (2019) as well as opening year (2027) No Build and opening year (2027) Build conditions. Existing year Vissim models were developed for the AM and PM peak and calibrated to the travel time and traffic count data. An extensive calibration process was followed throughout the development of Vissim models, and the results of the calibration process were within Federal Highway Administration (FHWA) guidelines. These calibrated Vissim models were modified to create No Build and Build conditions models for the opening year.

The Vissim models acted as a tool to identify and resolve issues at a microscopic level, helping to:

- Identify turn bay lengths to prevent queue spillback and blocking through traffic
- Identify short weave segments that caused congestion
- Code transit priority and non-standard signal phasing
- Identify excessive queuing along side streets at key signalized intersections and develop geometric modifications summarized in Section 4.3.1.3
- Moreover, Vissim is used to create simulation videos that are used for discussion and meetings

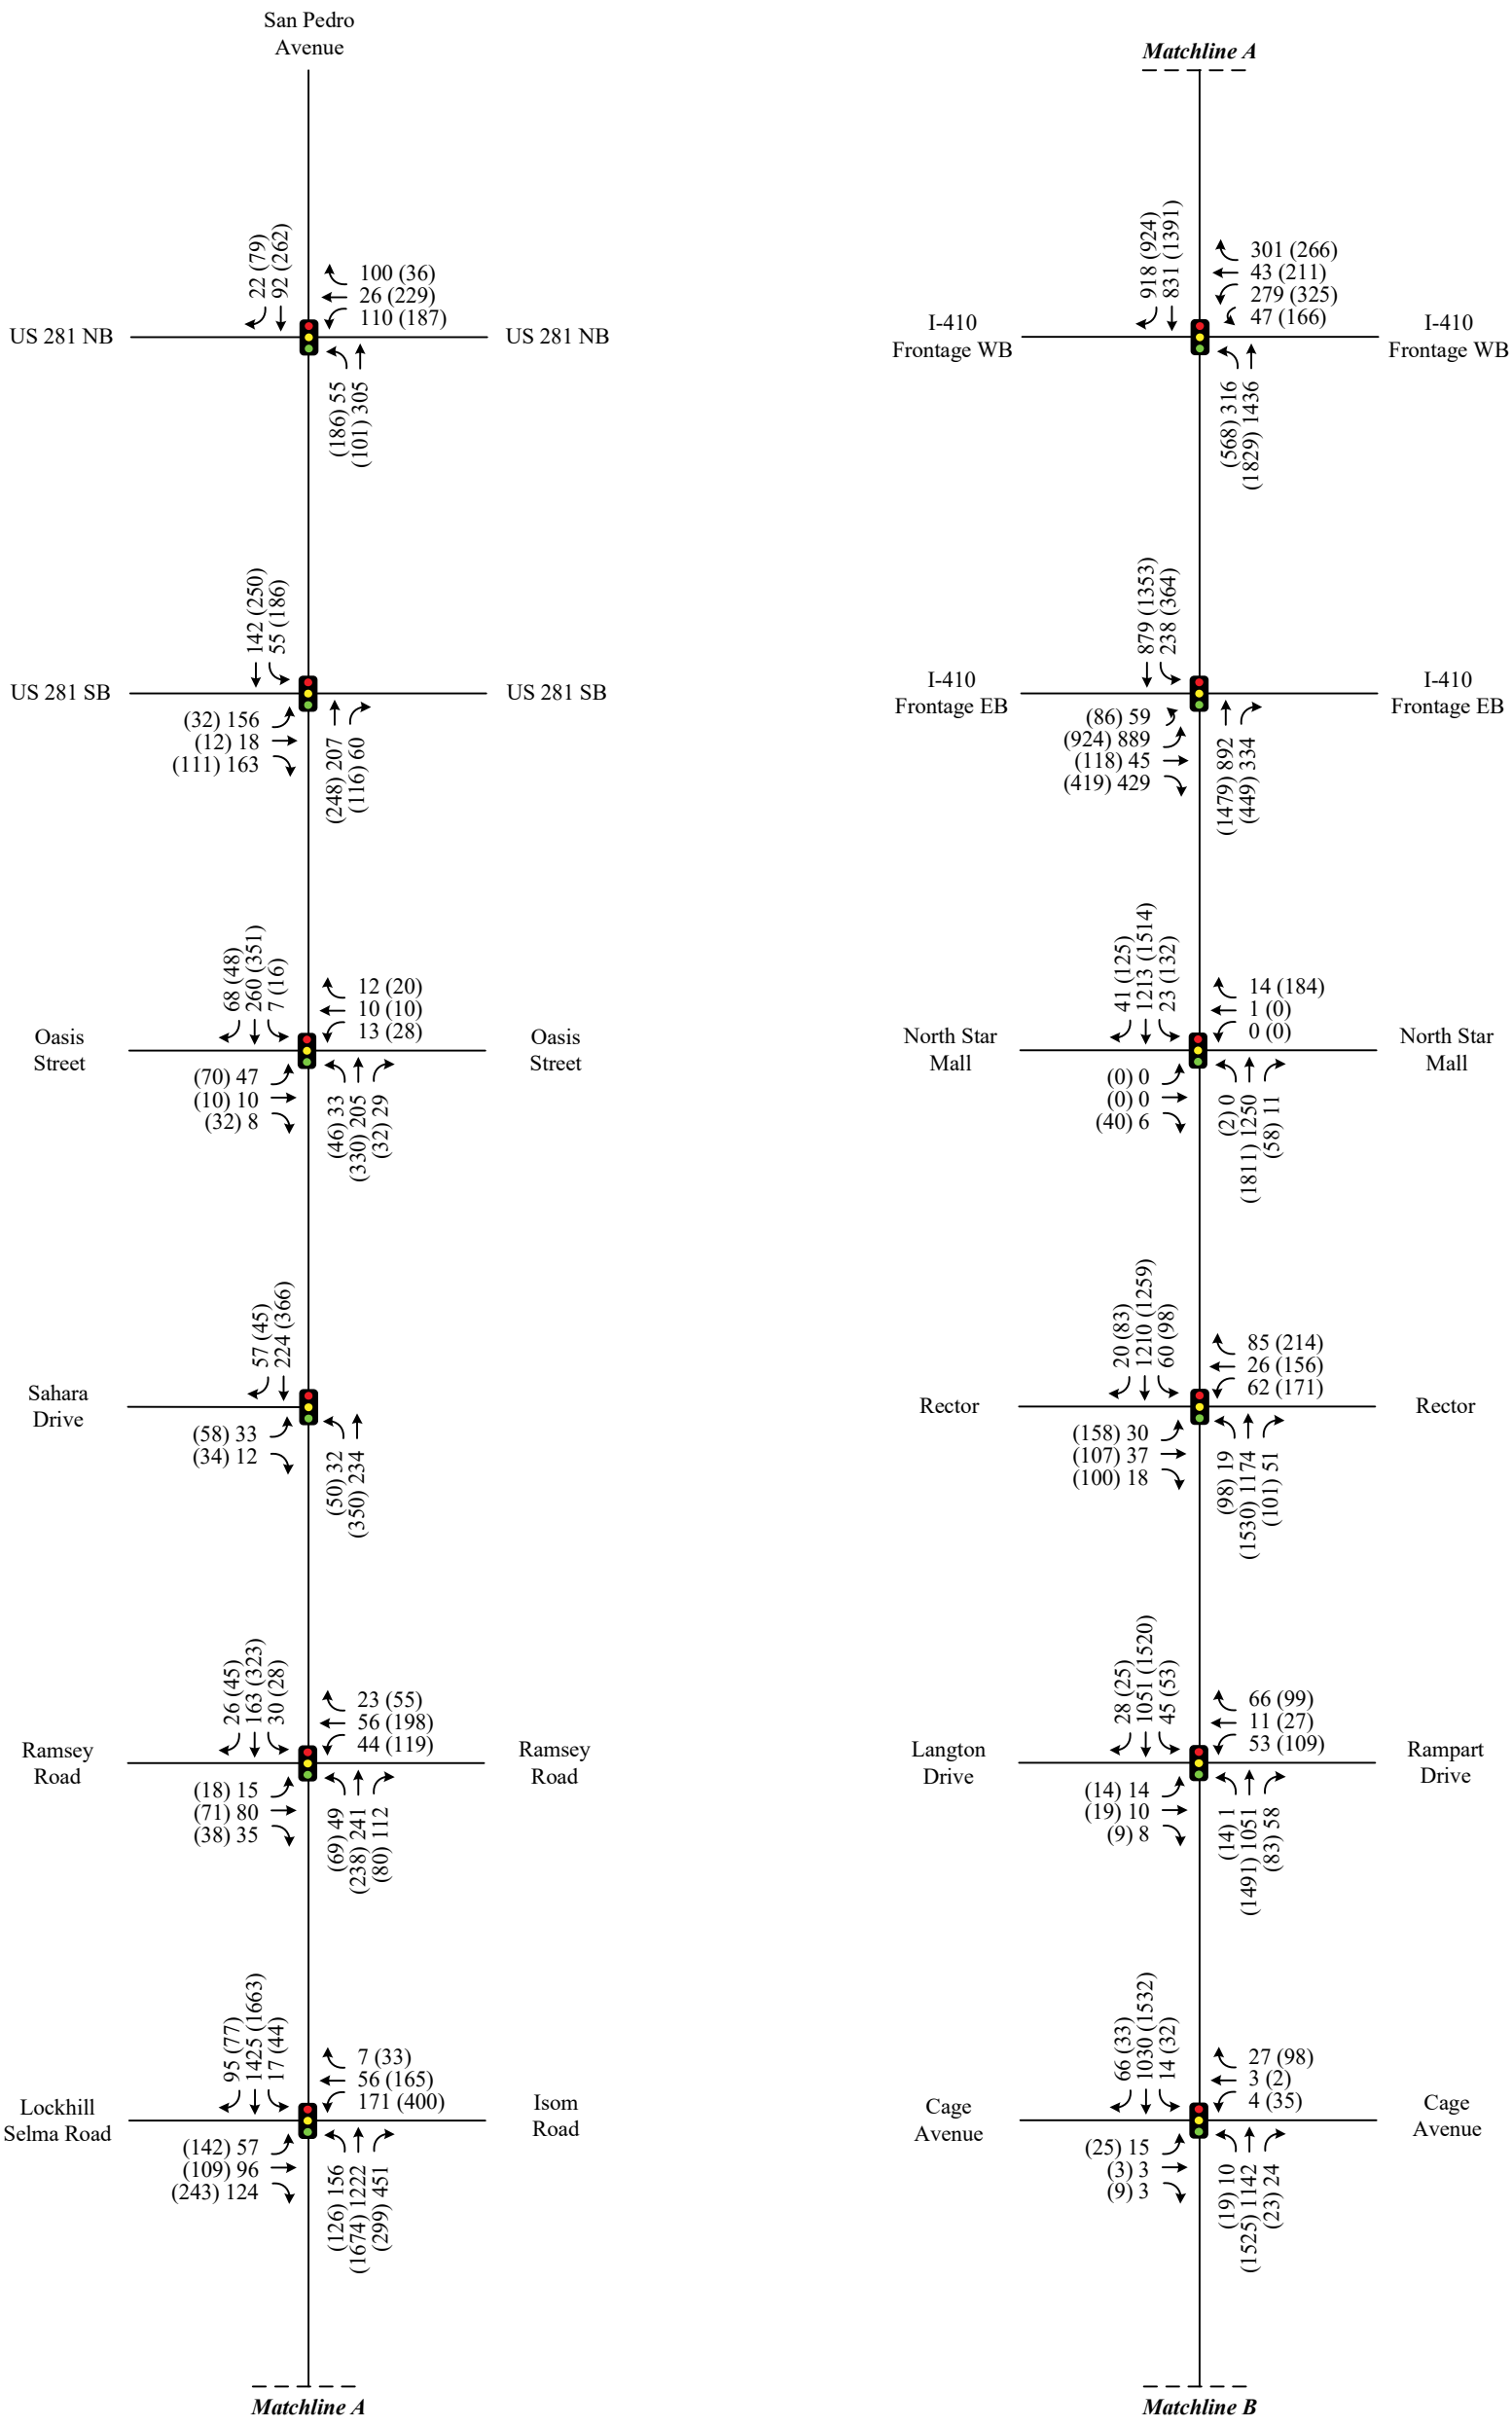
6. CONCLUSION

This analysis solely focuses on vehicle operations to determine geometric requirements and phasing schemes to provide satisfactory vehicular traffic flow. The existing roadway geometry without the ART project is referred to as No Build, and the roadway geometry with the ART project is referred to as Build in this memorandum. A summary of the results is as follows:

2027 AM Peak (Open Year)

- Without the ART N/S Corridor Project (No Build), 59 signalized intersections are expected to operate at LOS D or better, one signalized intersection is expected to operate at LOS E, and one signalized intersection is expected to operate at LOS F.
- With the ART N/S Corridor Project (Build), 60 signalized intersections are expected to operate at LOS D or better, one signalized intersection is expected to operate at LOS E, and none would operate at LOS F.
- This analysis suggests the ART N/S Corridor Project has no significant impact on traffic operations when compared with No Build.
- Traffic operations were improved by adding additional turn lanes and modifying the signal phasing and cycle length at the intersections.

2027 PM Peak (Open Year)



- Without the ART N/S Corridor Project (No Build), 57 signalized intersections are expected to operate at LOS D or better, two signalized intersections are expected to operate at LOS E, and two signalized intersections are expected to operate at LOS F.
- With the ART N/S Corridor Project (Build), 58 signalized intersections are expected to operate at LOS D or better, three signalized intersections are expected to operate at LOS E, and none would operate at LOS F.
- This analysis suggests the ART N/S Corridor Project has no significant impact on traffic operations when compared with No Build.
- Traffic operations were improved by adding additional turn lanes and modifying the signal phasing and cycle length at the intersections.

The results of the traffic analysis suggest that the application of the ART N/S Corridor Project is feasible, and it would have no significant impact on general traffic operations.

Moreover, the ART N/S Corridor Project also proposes to construct median through part of the project along San Pedro Avenue. TxDOT's Crash Record Information System (CRIS) was queried to obtain study area crash data for five years between 2015 and 2019. The goal of this was to identify crashes attributed to left turning vehicles that may be mitigated due to access management and restricted turns created by the proposed center-running median. Based on review of the crash data, the proposed center median is expected to reduce the crashes by approximately 15%. This further confirms that the application of the ART N/S Corridor Project is feasible and it is expected to reduce crashes along the corridor.
